Q1  
Gaussian Scale Space  
Synthetic

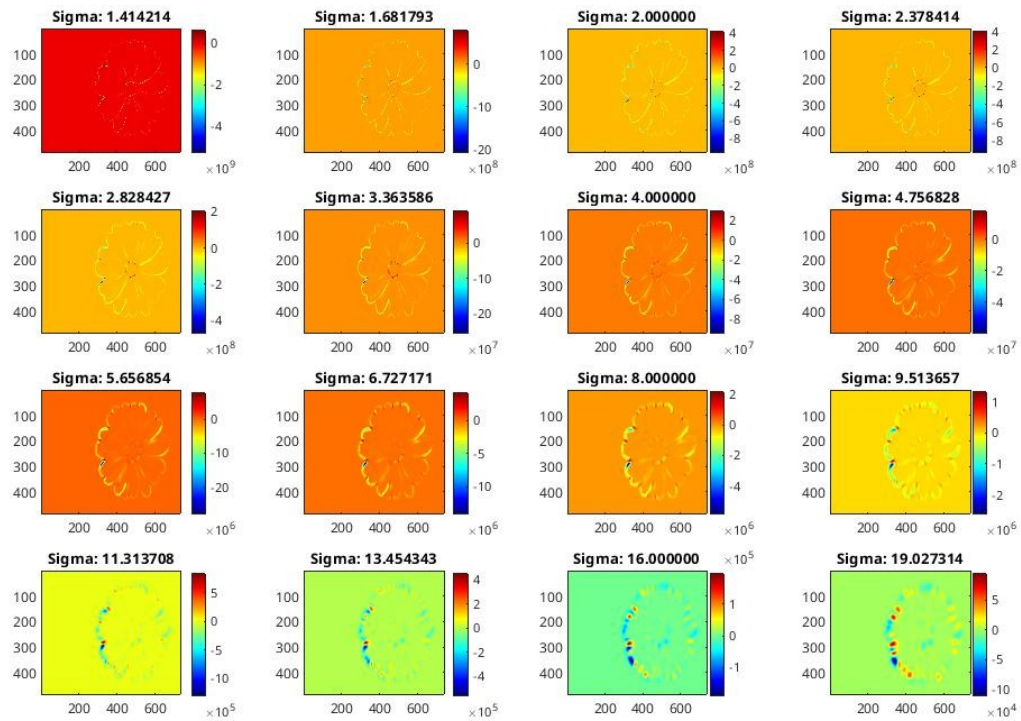

Natural

Q2  
Harris-Stevens  
Synthetic

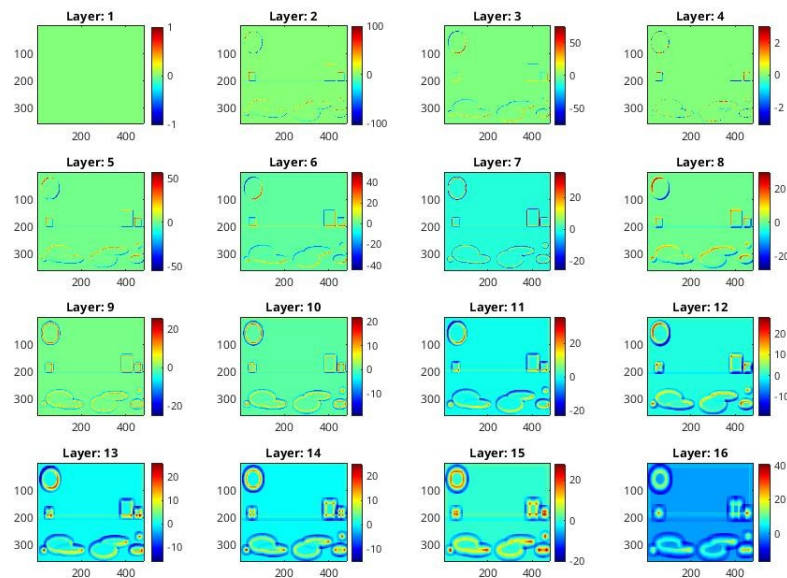

Natural

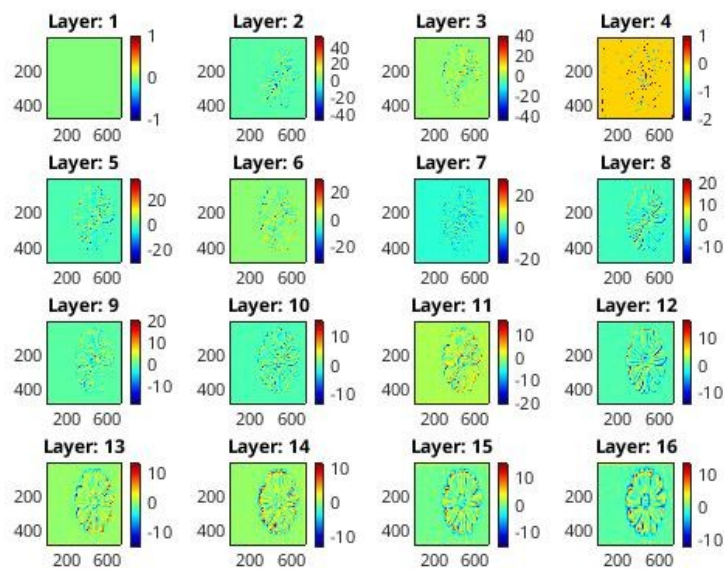

### Q3

#### Difference of Gaussian

#### Synthetic

#### Natural

#### Discussion:

Difference of Gaussian highlights the edges in the images. At higher scale space levels zero crossings became thicker. That is because the blurred image has less pronounced edges.

Q4  
SIFT Keypoint Detection  
Synthetic

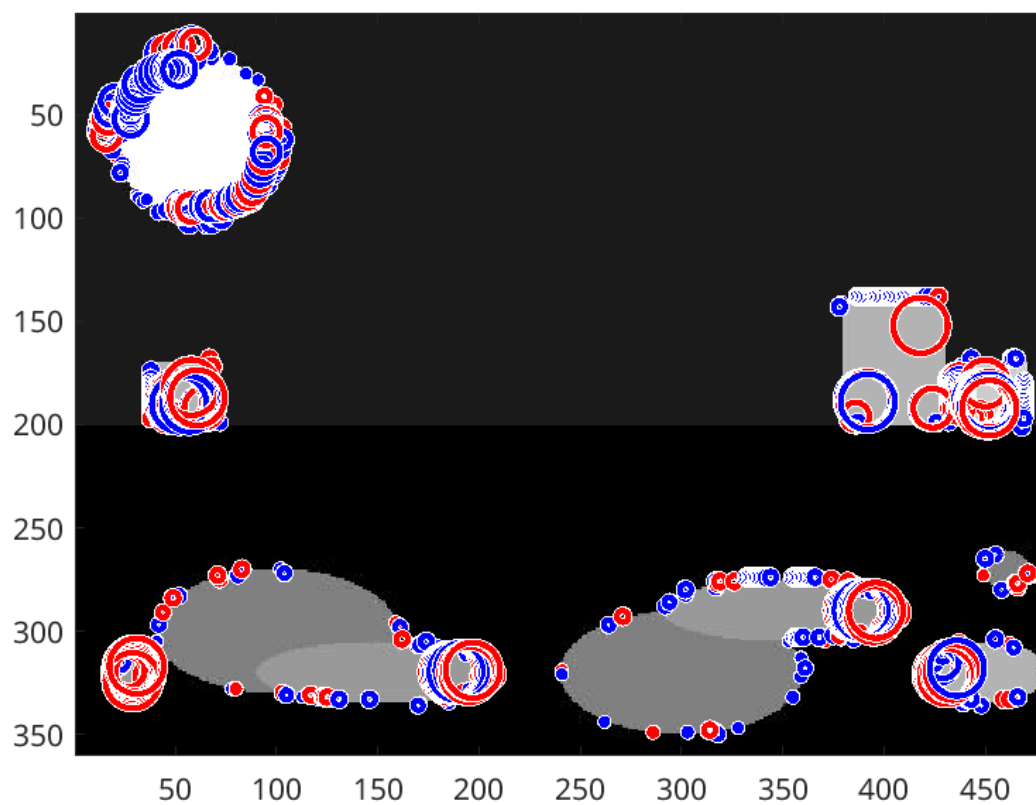

Natural

Q5

Hessian Constraint  
Synthetic

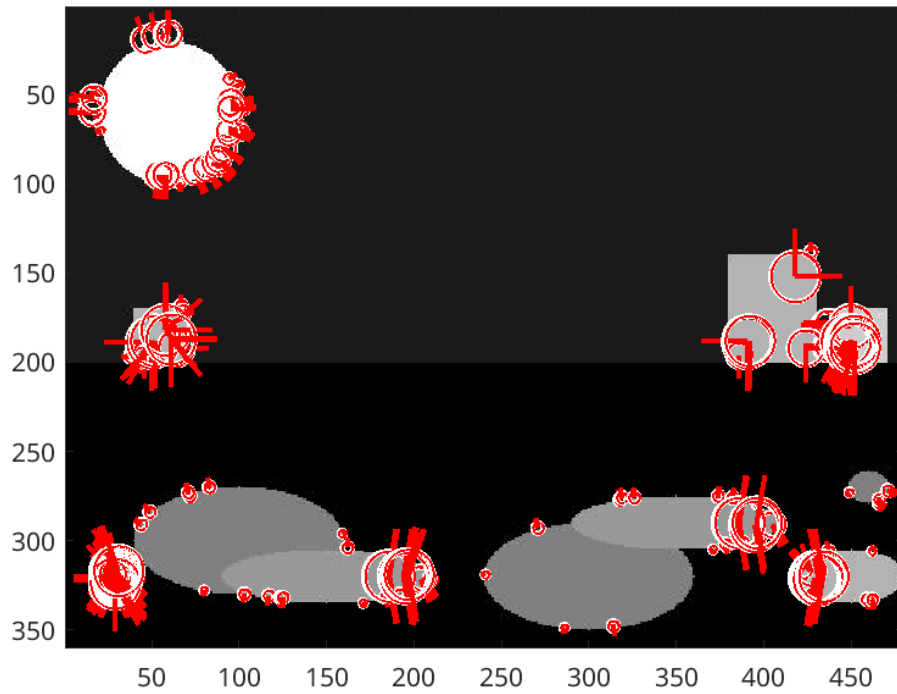

Natural

Approximating hessian by getting a neighborhood, and computing the gradient of  $x$   $y$  in order to obtain the hessian matrix.

Q6

Synthetic

Natural

Q7

Key points in the newly re-scaled images correspond in the expected way with the key points in the original images. See below for a scaled version of the synthetic image and natural image.
